                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                     US-09-937-636-3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New human obesity protein binding protein-2 homologue nucleic acids, polynucleotides and polypeptides useful for producing medicament for treating obesity and/or obesity-related disorders.

Claim 9; Page 86-88; 92pp; English.

This sequence is a human obesity protein binding protein-2 homologue (hOB-BP2h) of the invention. The hOB-BP2h nucleic acids and polypeptides may be used for the manufacture of a medicament for the treatment of obesity and/or obesity-related disorders. The hOB-BP2h nucleic acids are useful as probes or amplification primers in the detection, quantification or isolation of gene sequences or transcripts, for recombinant expression of hOB-BP2h polypeptides, as immunogens in the preparation and screening of antibodies, and in sense or antisense suppression of one or more hOB-BP2h genes or nucleic acids, host cell or tissue in vivo or in vitro. Antigenic epitope-bearing peptides and polypeptides are useful for raising or screening antibodies that specifically binds to the hOB-BP2h polypeptides.

The invention relates to an isolated SIGLEC (Gialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising (I) related lectin) protein (I). Pharmaceutical compositions comprising (I) are useful for treating immunes system diseases such as asthma, leukaemia or or other allergic or inflammatory diseases. Extracellular domains of (I) to assays, and imaging methods. (I) is useful as a target for drugs which inflammatory diseases such as allergic remodeling in asthma, and cinflammation, tissue damage and remodeling in asthma, and cinflammatory diseases such as allergic rhinitis, osteoarthritis, Crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS uncleotide sequences and/or SIGLEC-BMS uncleotide sequences and/or signed probes are useful for screening genomic library to isolate a genomic clone of SIGLEC-BMS sortions of under is determined for detecting diseases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS proteins and in diagnostic imaging technology.

ANURTONA-AAURTONA-AAURTONBY represent human SIGLEC amino acid sequences of the Novel isolated SIGLEC (sialic acid-binding Ig-related lectin) protein molecules useful for treating immune system diseases such as asthma, leukemia, allergic rhinitis, psoriasis, conjunctivitis, Crohn's disease. Example 11; Fig 6; 209pp; English WPI; 2002-241565/29. N-PSDB; ABK43373.

```
The invention relates to an isolated nucleic molecule that is at least 95% identical to 18 human cDNA sequences representing 12 novel genes encoding secreted proteins or a polynucleotide fragment of the cDNA sequence contained in American Type Culture Collection (ATCC) deposit No. defined in the specification, its species homologue, a variant or allelic

```
the polymucleotide having a polymucleotide capable of does not hybridising under conditions the polymucleotide, where the polymucleotide does not hybridise under stringent conditions to a nucleic acid molecule having a nucleotide sequence of only A or T residues. Also included are recombinant vectors, host cells (for producing the polypeptide), the secreted polypeptide (comprising a sequence that is at least 95% identical to a polypeptide fragment, domain, epitope, full-length protein, variant, allelic variant or species homologue), antibodies that specifically bind to the polypeptides, diagnosing, treating, preventing or amelicrating a medical condition by administering the polymucleotide or the polypeptide, the gene corresponding to the CDNA sequence and identifying an activity in a biological assay dud detecting the supernatant, and detecting an activity or a polypeptides, nucleic acids and antibodies are useful for diagnosing a pathological condition, for preventing, treating, or amelicrating a medical condition, for preventing, treating, or amelicrating a custom as public acids and antibodies are disorders, neurological and blood clotting disorders (many examples are corresponding immunological probes for differential identification of the formy providing immunological probes for differential identification of the cissues immunological probes for differential identification of the tissues immunological probes for differential identification of the cissues immunological probes for differential identification of the cissues immunological probes for differential identification of the cissues immunological probes and anibodies are useful for increase or decrease storage capabilities, fat content or other manning immunological probes for differential identification of the increase or decrease storage capabilities, fat content or other increase or decrease storage capabilities, fat content or other increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 FKAVTETTKGAPVATNEQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV 120

The present invention describes human cell surface protein with immunoglobulin folds, designated BGS-19 (1). (1) has cytostatic, gynaecological, immunosuppressive, antinilammatory, antiasthmatic, antidiabetic and dermatological activities, and can be used in gene therapy. (1) can be used for preventing, treating or ameliorating a medical condition, such as a disorder related to aberrant immunoglobulin cell surface receptor activity, a cellular adhesion disorder; a disorder related to aberrant signal transduction; a reproductive disorder related to byper- or hypo-immunoglobulin receptor activity; a disorder related to byper or hypo-immunoglobulin receptor activity; a disorder related to aberrant signal transduction; a reproductive disorder; dysfunctional uterine bleeding; amenorrhoea; primary dysmenorrhoea; exual dysfunction; interility; pelvic inflammatory disease; endometriosis; placental aromanase deficiency; premature menopause; placental dysfunction; hormone deficiency; oestrogen deficiency; aberrant aberrant ovarian cycle; menorrhagia; metrorrhagia; menometrorrhagia; dysmenorrhoea; hypomenorrhoea; polymenorrhoea; dysfunctional uterine bleeding; resistant-ovary syndrome; hermaphroditism; immune disorders; inflammatory disorders; arthritis; asthma; immunodeficiency diseases such as AIDS; leukaemia; rheumatoia arthritis; granulomatous disease; inflammatory bowel disease; sepsis; acne; neutropenia; neutrophilia; androgen metabolism; aberrant onset of female puberty; aberrant showing of female primary sexual characteristics; aberrant showing of female secondary sexual characteristics; precocious puberty; precocious peeudopuberty; incomplete isosexual precocity; premature thelarche; New isolated nucleic acid molecule encoding BGS-19 polypeptides, useful for preventing, treating or ameliorating a medical condition, such as a disorder related to aberrant immunoglobulin cell surface receptor remature adrenarche; premature pubarche; polycystic ovarian disease; Example 1; SEQ ID NO 7; 224pp; English. activity

                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information cereaived from other cells and the immediate environment. The information is often transmitted by secreted polypepides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the CDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondsorytes. The nucleic activities through the consecution in a mammal: In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

Claim 10; Fig 7; 695pp; English.

The present invention relates to PRO proteins and their coding sequences.
The PRO proteins are useful for diagnosing and treating a B cell related disorder, eg. X-linked infentile hypogammaglobulinemia, polygacdharide antigen unresponsiveness, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency, Burkitt's immunodeficiency with hypogammaglobulinemia of infancy, Burkitt's immunodeficiency with hypersensitivity, rheumatoid arthritis, autoimmune mediated haemolytic anamia, mysthenia gravis, hypoadrenocorticism, glomerulomephritis, or anamia, mysthenia gravis, hypoadrenocorticism, glomerulomephritis, or anamylosing spondylitis. The PRO proteins are also useful for preparing a medicament for treating a condition that is responsive to the PRO proteins, e.g. cancer or immune-mediated inflammatory diseases. The PRO coding sequences are useful as hybridization probes in chromosome and gene mapping, in preparing PRO proteins, or in generating transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents.

The invention relates to an isolated mucleo, actor mousecule (prower) concoding a human secreted protein, representing one of 85 novel genes. Also included are recombinant vectors, host cells (expressing the protein), the secreted proteins (including their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition based on the presence or absence of a mutation in the mucleic acid and diagnosing a condition based on the presence or amount of expression of the protein in a biological sample and diagnosing a condition of comprising determining the presence or amount of expression of the protein in a biological sample and diagnosing a condition based on the presence or amount of expression of the protein in a biological sample and diagnosing a condition based on the presence or amount of expression of the protein in a biological sample and diagnosing a condition based on the presence or amount of expression of the protein in a biological sample of the protein, preventing, treating or ameliorating a medical condition by administering the nucleic acid or protein, the gene corresponding to the protein in the supernatant thaving the activity in a biological assay (comprising expressing the nucleic acid in a cell, isolating the special or protein and proteins display the following activities Cytostatic, antibacterial, virucide, Neuroprotective, Gynaecological, Gastrointestinal-Gen, Respiratory-Gen, Immunosuppressive, Gerebroprotective, Vasotropic, Cerebroprotective, The methods and compositions of the present prognosticating disorders related to the novel polypeptides, such as prognosticating disorders related to the novel polypeptides, such as prognedial or viral infections, and neural, immune system, blood, The invention relates to an isolated nucleic acid molecule (CDNA) Claim 11; SEQ ID NO 141; 554pp; English.

The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising (I) are useful for treating immune system diseases such as asthma, leuksemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, follow-up dasasys, and imaging methods. (I) is useful as a target for drugs which inhibit inflammation, tissue damage and remodeling in astarget for drugs which inflammatory diseases such as allergic rinnitis, osteoarthritis, crohn's disease, psoriasis, rheumatorid arthritis, conjunctivitis, crohn's disease, psoriasis, rheumatorid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleocide sequences and/or SIGLEC-BMS proteins in a biological sample. (II) are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of SIGLEC gene. SIGLEC-BMS antibodies are also used to detecting or proteins. The SIGLEC-BMS such object is determined for detecting expressing SIGLEC-BMS proteins and in diagnostic imaging technology.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                        The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to oreate transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood cogulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34389, and AAX41685 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention

AAC78458 to AAC78599 represent polynucleotide and BST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78630 to AAC78837 represent PCR primers and probes used in the isolation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ľ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

The PRO polypeptides and their associated nucleic acids can be used to rhe PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Wammals include dogs, cats, cattle, horses, sheep, pigs, goats mammal. Wammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adernal, hung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV 120

WPI; 2001-602746/68. N-PSDB; AAS45983.

Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and screen for modulators of the compounds.

Claim 11; Fig 118; 774pp; English.

AAU29082 standard; protein; 544 AA.

Human PRO polypeptide sequence #59.
